a
500 GPa, 5,500 K
b
500 GPa, 6,000 K
c
400 GPa, 5,000 K
linear fit of $n = 1, 2, 4$, extrapolated to $x = 0.25$
crystal TDI, $H_{2.25}O$
ghost insertion, $n = 1, 2, 4$ (pressure-corrected)
insertion values for this state not in repo notes
$\mu_H - G_H^{pure}$ (meV per added H)
added H per O, x
